

CYBERPRO AI INTERNSHIP

Week 06 Work Report

CPAI-2026-006

Prepared By: Britton Smith

Reporting Period: Week 06

Course: CPIN-280 Cyber Security Internship

Bottom Line Up Front (BLUF)

Week 6 activities focused on completing the Cympire Cyber Range **Breaking Barriers** exercise through exploitation and post-exploitation operations. The largest challenge encountered was an environmental issue that prevented the Metasploit Framework from launching normally within the provided Kali Linux virtual machine. After systematic troubleshooting, the issue was resolved by launching Metasploit directly from its installation directory, allowing the assessment to continue. Additional challenges included locating appropriate password-cracking resources and adapting to tooling limitations within the lab environment while completing the required credential analysis. Throughout the engagement, collaboration with Professor Rami Salahieh, CyberProAI personnel, and fellow interns provided valuable guidance and reinforced the importance of documenting troubleshooting methodology alongside technical findings. Successfully overcoming these obstacles strengthened practical skills in vulnerability exploitation, Linux post-exploitation, problem solving, and technical documentation while demonstrating the persistence and adaptability required during real-world cybersecurity assessments.
